

DOCKER

Docker ps [# get all the running containers]

Docker ps -a [# get all the containers including the stopped one]

Docker ps -a --filter "name=zealous_cray" [# get specific by filter]

```
ubox161@ubox-161:~/Desktop/Test for docker$ docker run -d -p 3000:3000 --name
nestjs-container my-nest-app
a4844d5972ac733321555dff6eaf6b32c8c698ae9a5e9062465d6b23148b34a0
```

Command	Purpose
<code>docker build -t app .</code>	Build image
<code>docker run -d -p 3000:3000 app</code>	Run container
<code>docker ps</code>	List running containers
<code>docker stop <container-id></code>	Stop container
<code>docker logs <container-id></code>	View container logs
<code>docker exec -it <container-id> sh</code>	SSH into container

✅ Option 3: Push to Docker Hub (or your own private registry)

If you want to make it available anywhere via internet:

📦 Step 1: Tag your image for Docker Hub

(if your Docker Hub username is `moinali` for example)

bash

CopyEdit

```
docker tag wayventures_backend:latest moinali/wayventures-backend:latest
```

📦 Step 2: Push it to Docker Hub:

bash

CopyEdit

```
docker push moinali/wayventures-backend:latest
```

 Step 3: On any other machine (with Docker installed):

bash

CopyEdit

```
docker pull moinali/wayventures-backend:latest
```

 Step 4: Run it:

bash

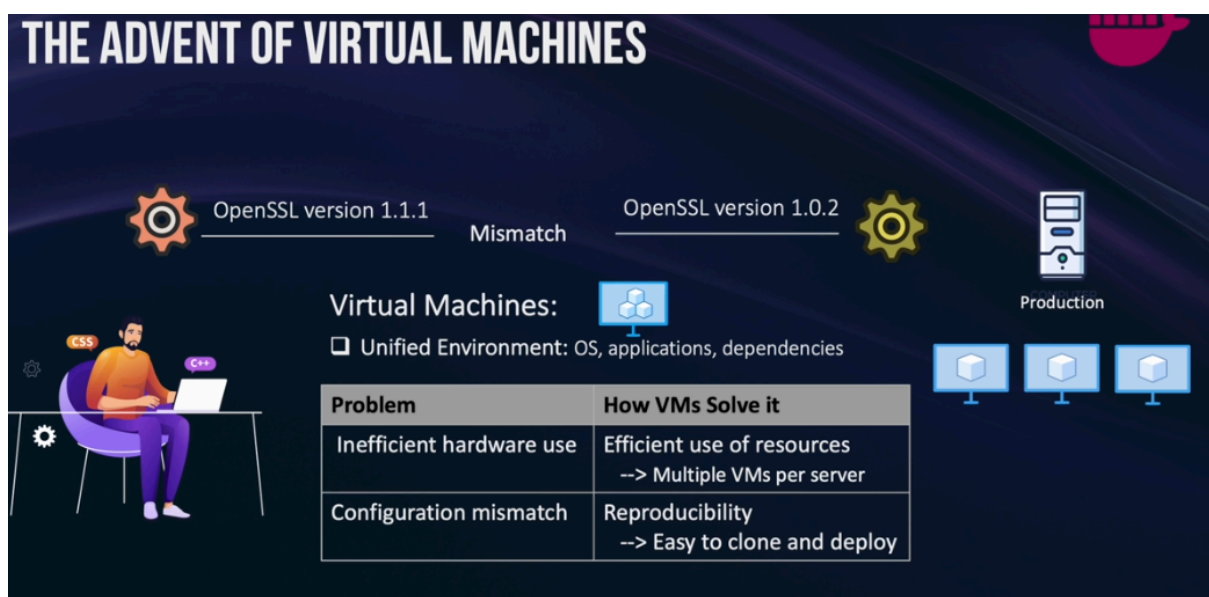

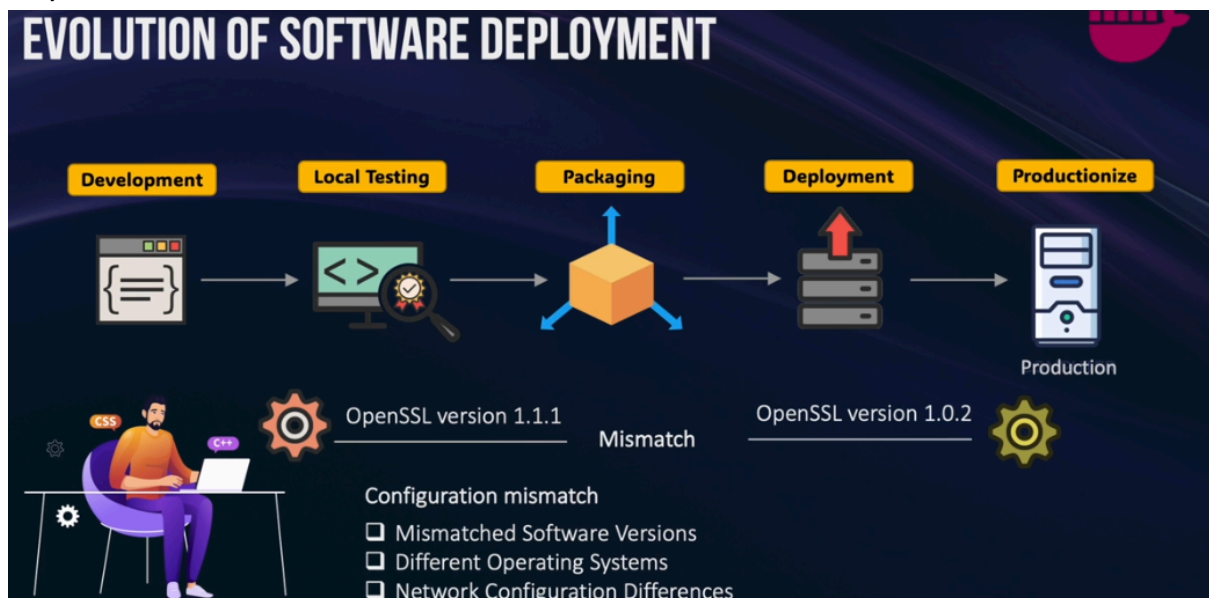

CopyEdit

```
docker run -d -p 3000:3000 --name wayventures-backend  
moinali/wayventures-backend:latest
```

 Now you can share this with your team or servers worldwide.

```
docker run --env-file .env -p 3000:3000 --name wayventures-backend  
moinali01/wayventures-backend:latest
```

Why we need Docker?

CONTAINERS

Metric	Virtual Machines	Containers
Resource Efficiency	<u>Heavy</u> : OS (CPU, RAM, etc.)	<u>Light</u> : Share host OS (only apps)
Scalability and Speed	Slow (loads entire OS)	Instant start
Consistency across Envs	Moderate (config drift)	Very consistent

There is one more limitation of VMs that is **configuration drift**.

Summary:

VIRTUAL MACHINES VS DOCKER CONTAINERS
